

## New - Save on Tooling & Production in China

Undoubtedly, the 'Made in China' phenomenon is so successful due to the financial advantages gained by moving production off shore.

### All Your Manufacturing Needs

Undoubtedly, the 'Made in China' phenomenon is so successful due to the financial advantages gained by moving production off shore. Accessing the cost benefits China has to offer though can be fraught with danger.

Quality issues, intellectual property infringement and long lead times on low volumes are prevalent throughout Chinese manufacturing industry. Communicating design modifications or production issues can also become a mammoth task. Too often companies haven't the budget or resources to ensure the benefits outweigh the challenges. Many a company has retired from Chinese production to lick it's wounds. Additionally, goods won't be shipped until funds are paid up front. If what arrives is of poor quality or incorrect in quantity, performance or any other parameter, the task of corrective action and cost recovery rests solely on the customer, and meanwhile costs tick up as delays occur. DAP can be a major help in this regard.

### Client Benefits

Our goal is to provide a competitive advantage by using Chinese manufacturers and suppliers while easing the challenges posed to a customer dealing direct and thereby reducing our clients' risk overall.

Allow Design Assist Partners to engage, manage and monitor your production in China. Our manufacturing relationships enable us to identify the most suitable companies to meet your requirements.

We enable our clients to focus on core business while we negotiate with the suppliers, obtain competitive quotations, engage manufacturers and sub contractors on your behalf, monitor progress, attend die trials and communicate your feedback to management and the shop floor.

Our production service provides our clients with greater control over the process, far less risk of failure and minimum effort on their part.

### Quality Control

DAP has developed a quality control system giving us the flexibility to customise a program that matches a client's product requirements and tolerances. During trials we establish acceptable standards and benchmark production against physical samples. Random sampling and inspections are performed to ensure standards are maintained.

#### Support Services - Component Sourcing & Final Assembly

Finding suppliers of standard parts is time consuming and difficult to perform remotely. Our on- ground resources in China are experienced and well positioned to locate the parts required.

To help protect intellectual property we utilise isolated workshops for final assembly, testing and packaging. Once we know a company's strategic requirements we can customise a manufacturing solution to suit those needs.
